In accessible language, he explains why good health is crucial to economic development, what indicators help track changes in global health, and requirements for good health systems. Approaches to solving world health problems must be under pinned by good ethics and human rights guidelines, he says, and local practices and cultures must not be ignored. He also maps out the key players in global health and looks ahead to future challenges.” —The Lancet, October 2007 The book is organized in four parts: - Principles, Measurements, and the Health-Development Link: The principles of Global Health; Health Determinants, Measurements, and Trends; and Health, Education, Poverty, and the Economy. - Cross-Cutting Global Health Themes: Human Rights, Ethics, and Global Health; An Introduction to Health Systems; and Culture and Health. - The Burden of Disease: The Environment and Health; Nutrition and Health; Women’s Health; Child Health; Infectious Diseases; Non-Communicable Diseases; and Unintentional Injuries. - Working Together to Improve Global Health: Conflicts, Natural Disasters, and Other Emergencies; Cooperating to Improve Global Health; and, Science Technology, and the Public’s Health.” Instructor Resources - Detailed Syllabus, updated each semester - Test

With a new preface assessing leadership responses to the coronavirus pandemic, this classic text explores leadership problems that can develop during public health crises such as the 2001 anthrax attacks, 2003 SARS epidemic, and 1980's-90's Mad Cow disease epidemic. A threat to public health, such as a rampaging virus, is no time for a muddled chain of command and contradictory decision making. *Who's In Charge? Leadership during Epidemics, Bioterror Attacks, and Other Public Health Crises*, re-issued with a new preface assessing leadership during the COVID-19 outbreak, explores the crucial relationships between political leaders, public health officials, and journalists to see why leadership confusion develops. As the problematic response to COVID-19 has once again shown, the reluctance of politicians to risk alarm can run counter to the public-health need to prepare for worse cases. Many leaders will seek high visible during a public health crisis, but since politicians are not medical experts the more they speak the more they risk disseminating harmful information. How to achieve the right balance is the essence of Dr. Kahn's book. Beginning by looking at the overarching issues of leadership and public health administration, it then examines in depth five emergencies - the 2001 anthrax attacks and 1993 cryptosporidium outbreaks, the 2003 SARS outbreak, the 2001 foot-and-mouth disease crisis, and the battle against Mad Cow Disease. First-person accounts from leaders involved in actual early 21st century crises, as well as leading experts, scientists, and others Primary documents including excerpts from official reports and the medical literature Chronologies of early 21st century public health emergencies A comprehensive index organized by disease and by individuals involved in emergency response

Over the past fifteen years, people in low- and middle-income countries have experienced a health revolution—one that has created new opportunities and brought new challenges. It is a revolution that keeps mothers and babies alive, helps children grow, and enables adults to thrive. Millions Saved: New Cases of Proven Success in Global Health chronicles the global health revolution from the ground up,

showcasing twenty-two local, national, and regional health programs that have been part of this global change. The book profiles eighteen remarkable cases in which large-scale efforts to improve health in low- and middle-income countries succeeded, and four examples of promising interventions that fell short of their health targets when scaled-up in real world conditions. Each case demonstrates how much effort—and sometimes luck—is required to fight illness and sustain good health. The cases are grouped into four main categories, reflecting the diversity of strategies to improve population health in low-and middle-income countries: rolling out medicines and technologies; expanding access to health services; targeting cash transfers to improve health; and promoting population-wide behavior change to decrease risk. The programs covered also come from various regions around the world: seven from sub-Saharan Africa, six from Latin America and the Caribbean, five from East and Southeast Asia, and four from South Asia.

The health of human populations around the world is constantly changing and the health profiles of most nations in the early twenty-first century global health landscape are unrecognizable compared with those of just a century ago. This book examines and explains these health changes and considers likely future patterns and changes. While the overall picture charted is one of progress and improvement, certain unfortunate regressions and stubbornly persistent health inequalities are equally shown to be part of the evolving patterns of global health. The chapters of the book are organized in three major parts: The first part introduces readers to the principal concepts of global health, and to the idea of populations having distinctive health profiles. In particular, it explores how those profiles can be measured, and how they change, using the umbrella concepts and theories of epidemiological and health transition. Building on the first section, the second part focuses on the evolution of health states, as well as paying particular attention to the reasons for the many subnational inequalities in global health. It also examines health challenges such as the continuing infectious disease burden and current emerging 'epidemics'. The final part transports readers from the current health scene to future possible and probable health scenarios, acknowledging the challenges presented by global environmental change, as well as issues centred around geopolitics and human security. Using clear and original explanations of complex issues, this text makes extensive use of boxed case studies and international examples, with thought-provoking discussion questions posed for readers at the end of each chapter. Global Health is essential reading for students of global health, public health and development studies.

Evaluating Public and Community Health Programs Evaluating Public and Community Health Programs combines an introduction to public and community health program evaluation with a detailed survey of methods in community assessment, planning, program design, quantitative and qualitative data collection, data analysis, and reporting of findings. The book presents an approach built on the two primary evaluation frameworks that are most common in public and community health: the Donaldson three-step program theory-driven evaluation model and CDC's six-step Framework for Program Evaluation in Public Health. The author emphasizes practical, ongoing evaluation strategies that involve all program stakeholders, not just evaluation experts, and presents a simple and effective standards-based four-step model that will produce rich and useful results. The book's resources (scenarios, worksheets, and guidelines) can be used throughout the planning, implementation, and evaluation process. In addition, each chapter includes a list of learning objectives, key terms, and ideas for review, as well as summaries and discussion questions that can reinforce each chapter's lessons.
