This book offers a comprehensive and timely overview of internal combustion engines for use in marine environments. It reviews the development of modern four-stroke marine engines, gas and gas-diesel engines and low-speed two-stroke crosshead engines, describing their application areas and providing readers with a useful snapshot of their technical features, e.g. their dimensions, weights, cylinder arrangements, cylinder capabilities, rotation speeds, and exhaust gas temperatures. For each marine engine, information is provided on the manufacturer, historical background, development and technical characteristics of the manufacturer's most popular models, and detailed drawings of the engine, depicting its main design features. This book offers a unique, self-contained reference guide for engineers and professionals involved in shipbuilding. At the same time, it is intended to support students at maritime academies and university students in naval architecture/marine engineering with their design projects at both master and graduate levels, thus filling an important gap in the literature.

When the world was a much younger place, Lyndon and Helen grew up in an idyllic coastal setting and fell in love. There is nothing unusual about this, except that they experienced this in many past lives. Furthermore, what they perceived as real sometimes did not make any sense, especially in their dreams. Arthur Koestler wrote that dreaming can be seen as "sliding back towards the pulsating darkness, of which we were part before our separate egos were formed." During the fourth century BC, Plato maintained that what we see and touch is not reality, but only

shadows as ethereal as the reflections from a fire in a cave. The illusion of reality is how we comprehend the shadows. But beyond this imperfect perception is Logos, the intangible "collective consciousness," as Karl Jung once coined, which binds us all and permeates throughout the living cosmos. Here is an idea that the combined experiences and wisdom of all people throughout the ages lie deep like water in the well of the unconscious individual mind. Together, amidst their numerous destinies within the ever-changing interdimensional flux, Lyndon and Helen eventually found their utopia. Here they remain as young lovers, sharing their subliminal reality with us. Is this the stuff of reality, dreams, or madness? As Cervantes declared in Don Quixote, "Maddest of all is to live life as it is and not as it should be." Perhaps Logos really is the mind of God.

In spite of progress in the development of alternative powertrain systems and energy sources, the internal combustion and all its derivatives still are and will be the main powertrain for automobiles. In SI-engines, several approaches compete with each other like the controlled auto ignition (CAI or HCCI), throttle-free load control using variable valvetrains, stratified mixture formation with lean engine operation or highly turbo charged downsizing concepts all combined with gasoline direct injection. The presented work makes a contribution for a deeper understanding of the combustion process of a turbo charged direct injection engine operating with external EGR as well as lean stratified mixture. Using detailed test bench investigations and introducing a new optical measurement tool, the combustion process is described in detail focusing on the occurrence of non-premixed combustion phenomena. The influence of engine parameters like global and local air-/fuel ratio, external EGR and fuel rail pressure as well as the influence of fuel parameters are discussed giving a characterization of the combustion process of stratified engine operation. Furthermore, the influences of non-inert exhaust gas components on engine knock tendency are investigated using external EGR with an EGR catalyst. Opposing the results to numerical analysis, combustion characteristics of turbo charged DISI-engines are presented.

Emma Coates and Joshua Thomas explore changing realities in this sequel to Just Ten Minutes. To avoid the catastrophic consequences of global warming, they get ready to return to the past with a plan to help cool the earth. Before they can leave, security in Lab One is breached and the Voyager is piloted back in time. Emma must rely on her younger self to find and stop the thief before time runs out.

The special anniversary edition of The Little Engine That Could™ contains the entire text and original artwork. Young readers, as well as parents and grandparents, will treasure the story of the blue locomotive who exemplifies the power of positive thinking.

Aero engine bearing chambers are complex machine elements inside the engines, supporting up to three concentric shafts on bearings. For safety reasons, the aero engines always employ rolling-element type bearings and therefore require a sufficient oil supply for lubrication in order to guarantee a reliable operation. As a consequence, a complex two-phase flow consisting of oil and sealing air governs the bearing chambers. A highly dynamic oil film, flowing along the chamber walls,

plays a vital role to fulfill the tasks of cooling, lubricating and cleaning the bearing chambers. The design and optimization process of the bearing chambers requires a detailed understanding in order to accurately simulate the film behaviour inside the bearing chambers. Based on the earlier experimental investigations, it is known that near the scavenge off-take a relatively thick film exists. The numerical model to simulate these films must therefore take into account the elliptical behaviour of such films. Among the different models, the Volume Of Fluid (VOF) Model offers the best compromise between accuracy and efforts. However, preliminary attempts to model a fully developed and turbulent test case from literature revealed an unphysical pressure drop and velocity profile in the gas phase above the film flow. An inadequate turbulence modelling near the gas-liquid interface was identified as the problem source. The 2-Equation turbulence models (k- epsilon & k- omega) were extended to achieve a substantial improvement.

There are lots of books about the Triumph Bonneville, about its history, performance, lineage and the minutiae of its specification, but none of them tell you what to look for when buying one secondhand. That's what this book is about – it aims to be a straightforward, practical guide to buying a used Bonnie. It won't list all the correct colour combinations for each year, or analyse the bike's design philosophy, or consider its background as part of a troubled industry – there are excellent books listed at the end of this one which do all of that. But hopefully it will help you avoid buying a dud. Point by point, it takes the reader through everything that needs looking at when buying a Bonnie, plus spares prices, which is the best model to buy for your needs, a look at auctions, restorations and paperwork. Over 29 years in production, the Bonneville is for some the definitive postwar British vertical twin, perhaps even the definitive British bike of all time, with all its strengths, weaknesses and character. Although there might seem to be a wide range of models and special editions, all are based around the same 649cc or 747cc vertical twin. There were plenty of changes over the years, but none of them changed the basic format of this classic British bike. Aside from all the history, the Bonneville remains a tremendous classic to own, so long as you're prepared to look after it. The last Bonnies truly deserve the term 'practical classic.' Whichever one you choose, it should be fast, agile and good looking, and on a twisty English B road, there's nothing like a Bonnie. One hundred colour photos, useful appendices and expert advice mean this book could save you thousands.
