GTTSE 2011. The school presents the state of the art in software language engineering and generative and transformational techniques in software engineering with coverage of foundations, methods, tools, and case studies.

This tutorial book presents revised and extended lecture notes for a selection of the contributions presented at the International Summer School on Generative and Transformational Techniques in Software Engineering (GTTSE 2009), which was held in Braga, Portugal, in July 2009. The 16 articles comprise 7 long tutorials, 6 short tutorials and 3 participants contributions; they shed light on the generation and transformation of programs, data, models, metamodels, documentation, and entire software systems. The topics covered include software reverse and re-engineering,

The LASER Summer School is intended for professionals from industry (engineers and managers) as well as university researchers, including PhD students. Participants learn about the most important software technology advances from pioneers in the field. Since its inception in 2004, the LASER Summer School has focused on an important software engineering topic each year. This volume contains selected lecture notes from the 10th LASER Summer School on Software Engineering: Leading-Edge Software Engineering.

This text contains the tutorial notes from the 2005 NASA Software Engineering Workshop. This volume contains five tutorials that are oriented to practitioners in the area of real-time software development. "Software Development for Safety-Critical Applications: Fundamental Concepts, Design Principles and Real-Time Programming," presented by Andrew J. Kornecki and Janusz Zalewski, looks at the lessons learned about pitfalls of real-time software development and will include view on the current state of practice in real-time safety critical software based on the instructors' experience with software products in aviation, nuclear, and medical industries. "Case Studies for Software Engineers," presented by Dewayne E. Perry, teaches the correct use and interpretation of case studies. "Designing Software Product Lines with UML: From Use Cases to

Pattern-Based Software Architectures," presented by Dr. Hassan Gomaa, addresses how to develop object-oriented requirements, analysis, and design models of software product lines using the Unified Modeling Language (UML) 2.0 notation.

"Decision Support for Software Release Planning Methods, Tools, and Practical Experience," presented by Guenther Ruhe, provides guidelines for release plans and lessons learned in performing RP.

"Architecture on Demand for any Domain Using Stable Software Patterns," presented by Dr. Mohamed E. Fayad, focuses on how software stability concepts are used to develop on-demand architectures.

Today, software engineers need to know not only how to program effectively but also how to develop proper engineering practices to make their codebase sustainable and healthy. This book

emphasizes this difference between programming and software engineering. How can software engineers manage a living codebase that evolves and responds to changing requirements and demands over the length of its life? Based on their experience at Google, software engineers Titus Winters and Hyrum Wright, along with technical writer Tom Manshreck, present a candid and insightful look at how some of the world's leading practitioners construct and maintain software. This book covers Google's unique engineering culture, processes, and tools and how these aspects contribute to the effectiveness of an engineering organization. You'll explore three fundamental principles that software organizations should keep in mind when designing, architecting, writing, and maintaining code: How time affects the sustainability of software and how to make

This tutorial volume includes the revised and extended tutorials (briefings) held at the 5th International Summer School on Grand Timely Topics in Software Engineering, GTTSE 2015, in Braga, Portugal, in August 2015. GTTSE 2015 applied a broader scope to include additional areas of software analysis, empirical research, modularity, and product lines. The tutorials/briefings cover probabilistic program analysis, ontologies in software engineering, empirical evaluation of programming and
